

## SPILLS DATA INFORMATION

This workbook provides information regarding spills from San Francisco's combined and separate sanitary sewer collection systems to surface waters for the month of June 2016. None occurred.

Taken from the EPA's 308 letter, Attachment 1:

9. "Spill" means any release of wastewater from any point in the Sanitary Sewer System or Combined Sewer System that does not enter or re-enter the Combined Sewer System. Spills do not include releases from privately-owned sewer laterals or authorized combined sewer discharges from any outfall permitted under the NPDES Nos. CA0037681 and CA0037664. Spill includes releases or diversions that are caused solely or in part by a lack of hydraulic capacity or excessive surcharge, including surcharges that occur in response to rain storms of any size, whether or not the pipe complies with the City's 5-year, 3-hour design storm standard.

The SFPUC has produced data responsive to this request, using the two following assumptions:

1. Spills do not include wastewater from the treatment plant
2. Spills mean wastewater releases which have reached a receiving water

Pursuant to the request of EPA staff, the SFPUC has included information in this workbook regarding a minor leak from the Southeast Treatment plant's final effluent outfall pipe located close to its authorized discharge point.
